

# Origination of micro-structures

- Telecom
- Micro-fluidics
- Bio-medical
- Sensors

In our class 100 clean room facility, we produce a range of customized microstructures for applications in micro-fluidics, micro-optics, and sensing.

These structures are provided in a range of materials including silicon, fused silica, epoxy resin and thermoplastics. They can be combined with other optical components to form complete sub-assemblies and micro-systems.
